Draft	Group 20	Initial version of the SRS document	08/03/2026

1 Introduction

1.1 Document Purpose

This document describes the software requirements for the **Smart Governance Intelligence System (SGIS)**.

The purpose of this document is to explain the features of the system, the roles of different users, and how the system is expected to work. It will help guide the development of the project and serve as a reference for our instructor and team members.

1.2 Product Scope

The Smart Governance Intelligence System (SGIS) is a web-based complaint management platform.

The system allows users to submit complaints about issues and track the progress of their complaints. Administrators can assign complaints to officers, and officers can update the complaint status until the issue is resolved.

The goal of the system is to improve transparency and make complaint handling more organized and efficient.

1.3 Intended Audience and Document Overview

This document is intended for:

- Developers working on the project
- The course instructor supervising the project
- Testers who will test the system
- Users and administrators of the system

This document first introduces the system and then explains the system features, functional requirements, and non-functional requirements.

1.4 Definitions, Acronyms and Abbreviations

Term	Meaning
SGIS	Smart Governance Intelligence System
UI	User Interface
Admin	System Administrator
Complaint ID	Unique ID for each complaint
DB	Database

1.5 Document Conventions

The document follows a structured format similar to the IEEE SRS format.

- Arial font is used
- Section numbers organize the document
- Bullet points are used to list system functions

1.6 References and Acknowledgments

The following materials were used while preparing this document:

- Software Engineering course material
- IEEE SRS documentation standard
- UML Modeling guidelines

2 Overall Description

2.1 Product Overview

The Smart Governance Intelligence System is designed as a web-based complaint management platform.

Users can submit complaints through the system, and the complaints will be stored in a database. Administrators can assign complaints to officers, and officers will work on resolving them.

Basic system flow:

User → Web Interface → Complaint System → Database

Admin → Assign Complaint → Officer

Officer → Update Complaint Status → System

2.2 Product Functionality

The system will provide the following functions:

- User registration and login
- Complaint submission by users
- Complaint tracking by users
- Assignment of complaints by admin
- Status updates by officers
- Escalation of unresolved complaints
- Feedback submission after complaint resolution

2.3 Design and Implementation Constraints

The following constraints apply to the system:

- The system will be developed as a **web application**.
- UML diagrams will be used to represent system design.

- A database will be used to store complaints and user data.
- An internet connection is required to access the system.

2.4 Assumptions and Dependencies

- **Assumptions**
- Users have access to the internet.
- Officers regularly check the system to update complaint status.
- The database server will remain available.
- **Dependencies**

The system depends on:

- Web server
- Database management system

3 Specific Requirements

3.1 External Interface Requirements

3.1.1 User Interfaces

The system will provide a simple and user-friendly web interface.

Main screens include:

- Login page
- User dashboard
- Complaint submission form
- Complaint tracking page
- Admin dashboard
- Officer dashboard

Users will interact with the system through forms, buttons, and menus.

3.1.2 Hardware Interfaces

. The system can be accessed using devices such as:

- Desktop computers
- Laptops
- Mobile devices

Software Interfaces

The system will interact with:

- Database management system (MySQL / PostgreSQL)
- Web browser

3.2 Functional Requirements

F1 – The system shall allow users to create an account.

F2 – The system shall allow users to log into the system.

F3 – The system shall allow users to submit complaints.

F4 – The system shall assign a unique complaint ID to each complaint.

F5 – The system shall allow users to track complaint status.

F6 – The system shall allow administrators to assign complaints to officers.

F7 – The system shall allow officers to update complaint status.

F8 – The system shall store complaint information in the database.

F9 – The system shall escalate complaints that remain unresolved.

F10 – The system shall allow users to submit feedback after complaints are resolved.

3.3 Use Case Model

Actors involved in the system:

- *User*
- *Officer*
- *Admin*

3.3.1 Use Case #1 (use case name and unique identifier – e.g. U1)

TO DO: Provide a specification for each use case diagram

Author – Group 24

Purpose - Allows users to submit a complaint through the system

Requirements Traceability – FR3, FR4, FR8

Priority - High

Preconditions - User must be logged into the system.

Post conditions - The complaint is stored in the database and assigned a unique complaint ID.

Actors – User

Flow of Events

1. Basic Flow -
 - User logs into the system
 - User opens the complaint submission form.
 - User enters complaint details.
 - User submits the complaint.
 - System stores the complaint in the database.
2. Alternative Flow - User cancels the complaint submission before submitting.
3. Exceptions - A system error occurs while saving the complaint.

3.3.2 Use Case #2

...

4 Other Non-functional Requirements

4.1 Performance Requirements

P1 – The system should load dashboards within a few seconds.

P2 – Complaint status updates should appear shortly after officers update them.

P3 – The system should support multiple users using the system at the same time.

4.2 Safety and Security Requirements:

- Users must log in before accessing the system.
- Only administrators can assign complaints.
- Only officers can update complaint status.
- User data must be stored securely in the database.

4.3 Software Quality Attributes

Reliability

The system should work consistently without frequent crashes.

Usability

The system interface should be simple and easy for users to understand.

Maintainability

The system should be modular so that new features can be added easily in the future.

5 Other Requirements

The system database should maintain information including:

- *User details*
- *Complaint records*
- *Complaint status history*
- *Feedback submitted by user*

Appendix A – Data Dictionary

Data	Description
User_ID	Unique identifier for each user
Complaint_ID	Unique identifier for complaints
Status	Current complaint status
Category	Category of complaint
Feedback	Feedback submitted after complaint resolution

Appendix B - Group Log

Date	Activity
Week 1	Created paper prototypes for system screens
Week 1	Designed system architecture diagram
Week 1	Defined functional and non-functional requirements
Week 2	Developed digital prototype
Week 2	Created complaint process flow diagram
Week 2	Designed database table structure
Week 2	Prepared testing sheet
